

1. Find two numbers whose difference is 100 and whose product is a minimum.

Numbers: x, y

$$x - y = 100$$

Minimize: $m = xy = (100 + y)y$

$$m' = 100 + 2y$$

$$m' = 0 \Rightarrow y = -50$$

$$\Rightarrow x = 100 + y = 50$$

$m'' = 2 > 0$ everywhere so we have

an absolute minimum at $y = -50$

2. Find the point on the line $6x + y = 9$ that is closest to the origin. Hint: minimizing distance is equivalent to minimizing distance squared!

Minimize $L = x^2 + y^2$
 $= x^2 + (9 - 6x)^2$

$$L' = 2x + 2(9 - 6x)(-6)$$

$$= 2x + 2 \cdot 36x - 2 \cdot 54$$

$$= 2(37x - 54)$$

$$L' = 0 \Rightarrow x = 54/37$$

$$L'' = 66 > 0 \text{ everywhere}$$

$$\Rightarrow \text{abs min at } x = \frac{54}{37} \quad y = 9 - 6\left(\frac{54}{37}\right)$$

$$\approx 1.46 \quad \approx 0.23$$

3. A stadium curve is the curve that bounds a rectangular region with half circles at opposite ends of the rectangle; think of a running track. Find the dimensions of a stadium curve that maximize the area of the enclosed rectangle if the perimeter of the stadium curve is 440 yards.

Area of square: $2r h$

Perimeter of curve: $h + h + 2\pi r = 2h + 2\pi r$

constraint: perimeter = 440 so

$$2h + 2\pi r = 440$$

$$h = 220 - \pi r$$

Area: $A = 2r h$
 $= 2r (220 - \pi r)$

Minimize: $A' = 2 \left[(220 - \pi r) + r(-\pi) \right]$
 $= 2 \left[220 - 2\pi r \right]$

$$A' = 0 \Rightarrow r = 110/\pi \Rightarrow h = 220 - \pi \left(\frac{110}{\pi} \right) = 110.$$

$A'' = -4\pi < 0$ everywhere, so it's a
 global max at $r = 110/\pi$

$$r = \frac{110}{\pi}, h = 110$$

4. A hiker is on the tundra two miles south of a road. The road runs east-west the hiker wishes to reach a point on the road 5 miles to the east. The hiker can travel at 3 mph on the tundra and 4 mph on the road. What path should the hiker take to minimize their travel time to their destination?

distance in tundra: l miles

time in tundra: $l/3$ hours

distance on road: $5-x$ miles

time on road: $(5-x)/4$ hours

$$\text{total time: } T = \frac{l}{3} + \frac{(5-x)}{4}$$

$$\text{But } l^2 = 2^2 + x^2 \quad l = \sqrt{4+x^2}$$

$$T = \frac{\sqrt{4+x^2}}{3} + \frac{(5-x)}{4}$$

$$T' = \frac{1}{3} \frac{x}{\sqrt{4+x^2}} - \frac{1}{4}$$

$$T' = 0 \quad 4x = 3\sqrt{4+x^2}$$

$$16x^2 = 9(4+x^2)$$

$$7x^2 = 36$$

$$x = \frac{6}{\sqrt{7}}$$

endpoints $x=0, 5$

Use closed interval method.

Compare

$$T(0) = 1.91$$

$$T(5) = 1.795$$

$$T(6/\sqrt{7}) = 1.69$$

↑
absolute min

5. The USPS will accept a box for shipment if the sum of its length plus girth (total distance around) does not exceed 108 inches. What shape of box with a square end has maximum enclosed volume and is acceptable for shipping? You may assume that girth is measured as perimeter of the square.

Volume: $V = x^2 y$

constraint: $4x + y = 108, 0 \leq x \leq 27$

$$y = 108 - 4x$$

$$V = x^2 [108 - 4x]$$

$$V' = 2 \cdot 108x - 12 \cdot x^2$$

$$= 2x [108 - 6x]$$

Use closed interval method:

endpoints $x = 0, 27$

crit pts $x = 0, \frac{108}{6} = 18$

↑ not interior; ignore.

$$V(0) = V(27) = 0$$

$$V(18) = 11664$$

So maximum volume at
 $x = 18, y = 36$

6. An isosceles triangle has base 6cm and height 12cm. Find the maximum possible area of a rectangle that can be placed inside the triangle with one side on the base of the triangle.

Area: $2 \times y$

similar triangles: $\frac{y}{3-x} = \frac{12}{3}$

$$y = \frac{12}{3} (3-x)$$

$$A = \frac{24}{3} [3x - x^2]$$

$$A' = \frac{24}{3} [3 - 2x]; A' = 0 \Rightarrow x = \frac{3}{2}$$

$$A'' = -\frac{48}{3} < 0 \text{ everywhere, so an abs. max at } x = \frac{3}{2}$$

dimensions: $x = \frac{3}{2} \text{ cm}, y = 12(1 - \frac{1}{2}) = 6 \text{ cm}$
