**1.** Find dy/dx if  $y = \arcsin(3x)$ .

$$\frac{d}{dx} \arctan(3x) = \frac{1}{\int 1 - (3x)^2} \cdot \frac{d}{dx} 3x$$

$$= \frac{3}{\int 1 - (3x)}$$

**2.** Find dy/dx if  $y = \arctan(\sqrt{4-x^2})$ .

$$\frac{dy}{dx} = \frac{1}{1 + (\sqrt{14-x^2})^2} \cdot \frac{1}{4x} \sqrt{14-x^2}$$

$$= \frac{1}{1+4-x^2} \cdot \frac{1}{2} \sqrt{14-x^2}$$

$$= -x \sqrt{(5-x^2)(\sqrt{4-x^2})^2}$$

**3.** A 12-foot ladder is leaning against a wall. Let x denote the distance of the base of the ladder from the wall, and let  $\theta$  be the angle between the ladder and the wall. How fast does the angle  $\theta$  change with respect to x?

$$\theta = \arcsin\left(\frac{x}{12}\right)$$

$$\frac{d\theta}{dx} = \frac{1}{\sqrt{1-\left(\frac{x}{12}\right)^2}} \cdot \frac{1}{12}$$

$$= \frac{1}{\sqrt{1-\left(\frac{x}{12}\right)^2}} \cdot \frac{1}{12}$$

**4.** I compute that  $d\theta/dx \approx 0.1$  when x = 7. What does this mean in language your parents can understand? Feel free to express your answer in terms of degrees instead of radians.

When the ladder is 7 ft from the wall,

the agle between the ladder and the wall

increases at a vale of Oil val/foot as

The base of the labler is shifted away from the wall.

degrees/ff
